

Troubleshooting Manual

"Iniciar backup" does nothing / doesn't change state

- Fully close the app (not just minimize it) and reopen it from the Desktop icon.
- If it happens again, you should now get an error window with the exact detail (instead of failing silently) — send us that text.
- Make sure there isn't another copy of the app already open (check the taskbar).

The iPhone can't reach the server

1. Confirm the iPhone and the PC are on the **same WiFi network** (check the exact name in WiFi settings on both — some routers have separate 2.4GHz/5GHz networks with similar-looking names).
2. From Safari on the iPhone, try opening the address the app shows you (e.g. `http://PC-NAME.local:8787/health`). If it doesn't load, try the "IP alternativa" the app also shows.
3. Confirm the server is on in the PC app ("Escuchando en el puerto...").
4. Check the Firewall rule exists: PowerShell (as administrator) → `Get-NetFirewallRule -DisplayName "iPhone WiFi Backup"`.

401 error "Missing or invalid X-Backup-Token header"

- The token in the Shortcut doesn't match your profile's token on the PC.
- In the Shortcut, check **every** action with an X-Backup-Token header — the value must be the Token variable **chip** (colored background), never the literal word "Token" typed as plain text.
- Copy the token again from the app ("Copiar token" button on the profile) and paste it into the corresponding **Text** action in the Shortcut.

403 error "This profile is paused"

- The profile is **Pausado**. Open the app → Principal or Perfiles tab → switch it to **Activo**.

409 error "no destination folder configured"

- That profile has no destination folder. Go to Perfiles → "Elegir carpeta..." for that profile.

The Shortcut runs but doesn't upload any new photo

- Check **"Find Photos"** has no stray filter (it should just say "Find Photos" with no extra conditions, only Sort/Order/Limit).

- If "Find Photos" has a low **Limit** and you've run it several times, it may keep checking the same oldest photos over and over — raise the Limit or turn it off for a full library backup.
- Confirm under Settings → Privacy & Security → Photos that the Shortcuts app has access ("All Photos" / "Always Allow").

The phone freezes while the Shortcut runs

- Go to Settings → Display & Brightness → Auto-Lock → **Never** (temporarily, while running a large backup).
- Runs with thousands of photos can take several minutes — that's normal, not a freeze.
- If it truly stops responding: a forced restart of the iPhone is safe, nothing is lost (the server-side run is just left unfinished, harmlessly).

How to check files are really being saved

No technical steps needed: open the destination folder you chose in Windows Explorer — you should see Year/Month subfolders with your photos and videos inside.

Still not working

Contact whoever helped you install the system, or check the project's GitHub repository to report the issue.
