

PunkBackup — Installation Manual

Note on language: the app opens in Spanish by default. Once it's open, go to "■ Configuración" and tap "English" — the whole interface switches instantly, no restart needed, and it's remembered next time. Screenshots and quoted button text below show the Spanish labels (what you'll see before switching), with the English meaning in parentheses.

What this system does

Automatically backs up photos and videos from one or more iPhones/iPads to your Windows PC, over local WiFi, no cable, no iCloud dependency. Each person/device gets its own profile with its own destination folder.

Requirements

- **Windows 10 or 11** PC.
- **Internet** connection (only for the initial install).
- The iPhone/iPad and the PC must be able to reach the **same WiFi network** at backup time.
- **Administrator** rights on the PC (asked once, for the Firewall rule).

This version requires a few Terminal (PowerShell) steps to install Python. A future double-click installer will remove this requirement.

Step 1 — Install Python

1. Open **PowerShell** (search it in the Start menu).
2. Run: `winget install --id Python.Python.3.12 --source winget --accept-package-agreements --accept-source-agreements`
3. Wait for it to finish (a few minutes).

Step 2 — Copy the project to your PC

1. Copy the whole project folder (the one shared with you) to a permanent location, e.g. `C:\Backup Photos and Videos`.
2. Open PowerShell **inside that folder** (right-click the folder → "Open in Terminal", or navigate there with `cd`).

Step 3 — Set up the environment

Run these one at a time, inside the project folder:

```
py -m venv .venv
.venv\Scripts\python.exe -m pip install --upgrade pip
.venv\Scripts\python.exe -m pip install -r requirements.txt
```

Step 4 — Create the Desktop shortcut

Run in PowerShell (adjust the path if you copied the project elsewhere):

```
$projectDir = "C:\Backup Photos and Videos"
$target = Join-Path $projectDir ".venv\Scripts\pythonw.exe"
$script = Join-Path $projectDir "main.py"
$desktop = [Environment]::GetFolderPath('Desktop')
$shortcutPath = Join-Path $desktop "PunkBackup.lnk"

$WshShell = New-Object -ComObject WScript.Shell
$Shortcut = $WshShell.CreateShortcut($shortcutPath)
$Shortcut.TargetPath = $target
$Shortcut.Arguments = '"' + $script + '"'
$Shortcut.WorkingDirectory = $projectDir
$Shortcut.IconLocation = $target + ",0"
$Shortcut.Save()
```

You should now see a new **"PunkBackup"** icon on your Desktop.

Step 5 — First launch and Firewall rule

1. Double-click the Desktop icon — the app opens (dark window, two screens: "Principal" (Main) and "■ Configuración" (Settings)).

If you'd rather read the rest of this in English on-screen too, go to "■ Configuración" now and tap "English".

2. Go to "■ Configuración" (Settings) → "+ Agregar perfil" (+ Add profile) → name your device (e.g. "iPhone de [your name]") → pick the folder where you want your photos saved.
3. Go to "Principal" (Main) → click "■ Iniciar backup" (Start backup).
4. The first time, Windows may show a **Firewall** prompt asking to allow the connection — accept it, checking at least **"Private networks"**.
5. It should say **"Estado: Escuchando en el puerto 8787"** (Status: Listening on port 8787).

Step 6 — Set up your iPhone

Follow the separate **iPhone Setup Manual** to create the Shortcut and, optionally, the WiFi automation.

Is it working?

- Check "■ Configuración" shows your profile with its destination folder.
- Run the Shortcut once on your iPhone as a test.
- Check the folder you chose — you should see Year/Month subfolders with your photos inside.

If something's not working, see the **Troubleshooting Manual**.
