

PunkBackup — Uninstallation Manual

Uninstalling this system is safe and **does not delete any of your already backed-up photos** — only the program itself is removed; your backup folders (on your disk or USB) stay exactly where they were.

Step 1 — Stop the server

1. Open the app (Desktop icon) if it isn't open.
2. If it says "Escuchando en el puerto...", click "**Detener backup**".
3. Close the window.

Step 2 — Remove the Firewall rule (optional)

Open PowerShell **as administrator** and run:

```
Remove-NetFirewallRule -DisplayName "iPhone WiFi Backup"
```

Step 3 — Delete the Desktop shortcut

Delete the "**PunkBackup**" icon from your Desktop (right-click → Delete), like any other shortcut.

Step 4 — Delete the program folder

Delete the folder where you installed the project (e.g. `C:\Backup Photos and Videos`). This removes the program, its configuration, and the list of profiles/tokens — it does **not** touch your already-backed-up photo folders, which live in a different location (the destination folder you chose per profile).

Step 5 — (Optional) Remove the Shortcut from the iPhone

1. On the iPhone, open **Shortcuts**.
2. Long-press the shortcut (PunkBackup) → **Delete**.
3. If you created a WiFi automation, go to the **Automation** tab → long-press it → **Delete**.
4. If you created a "Respaldado" album in an older version of this system (no longer needed in the current version), you can delete it from Photos → Albums.

What about my already-backed-up photos?

They stay exactly where they were, in the folder you chose — the system never moves or modifies them when uninstalled. You can keep using them normally, or reinstall the system later pointing at that same folder to pick up where you left off (the internal index lives inside that folder, so it's recognized automatically).
