

PunkBackup — Troubleshooting Manual

This manual shows the app in **English** — go to "■ Settings" → "English" if it isn't already switched (instant, no restart).

"Start backup" does nothing / doesn't change state

- Fully close the app (not just minimize it) and reopen it from the Desktop icon.
- If it happens again, you should now get an error window with the exact detail (instead of failing silently) — send us that text.
- Make sure there isn't another copy of the app already open (check the taskbar).

The iPhone can't reach the server

1. Confirm the iPhone and the PC are on the **same WiFi network** (check the exact name in WiFi settings on both — some routers have separate 2.4GHz/5GHz networks with similar-looking names).
2. From Safari on the iPhone, try opening the address the app shows you (e.g. `http://PC-NAME.local:8787/health`). If it doesn't load, try the "Fallback IP" the app also shows.
3. Confirm the server is on in the PC app ("Status: Listening on port...").
4. Check the Firewall rule exists: PowerShell (as administrator) → `Get-NetFirewallRule -DisplayName "PunkBackup"`. If it's missing (e.g. you skipped that checkbox during install), add it with `New-NetFirewallRule -DisplayName "PunkBackup" -Direction Inbound -Protocol TCP -LocalPort 8787 -Profile Private -Action Allow`.

401 error "Missing or invalid X-Backup-Token header"

- The token in the Shortcut doesn't match your profile's token on the PC.
- In the Shortcut, check **every** action with an X-Backup-Token header — the value must be the Token variable **chip** (colored background), never the literal word "Token" typed as plain text.
- Copy the token again from the app ("Copy token" button on the profile) and paste it into the corresponding **Text** action in the Shortcut.

403 error "This profile is paused"

- The profile is **Paused**. Open the app → "Main" or "■ Settings" → switch it to **Active**.

409 error "no destination folder configured"

- That profile has no destination folder. Go to "■ Settings" → "Choose folder..." for that profile.

The Shortcut runs but doesn't upload any new photo

- Check "**Find Photos**" has no stray filter beyond the `Date Taken is before Limit` one described in the iPhone Setup Manual — a different filter sneaking in makes it return 0 results silently, with no visible error.
- Check **Limit** is turned **on** and set to **50** on `Find Photos` — this is mandatory (not optional): without it, `Find Photos` fails outright on a large library, even doing nothing but counting results.
- Confirm under **iPhone Settings** → **Privacy & Security** → **Photos** that the Shortcuts app has access ("All Photos" / "Always Allow") — with limited access, a photo you just took or saved may simply not be visible to the Shortcut yet, with no error shown.

My library is huge (thousands of photos) — will the full backup ever finish?

The Shortcut sweeps your library backward in bounded blocks of 50, newest photos first, advancing automatically block after block within one run — see the "Set up the backward block-sweep" step of the iPhone Setup Manual. This is what makes a large library actually finish, instead of either timing out (no `Limit`) or getting stuck re-checking the same fixed set forever (a plain `Limit` with no way to advance).

- The number of blocks per run is controlled by the `Repeticiones` variable (a `Text` action near the top, defaults to 50). Confirmed working with `Repeticiones` up to 50 (≈2500 photos checked in one run). For your very first full backfill of a large library, it's fine to run the Shortcut several times in a row rather than pushing `Repeticiones` very high on the first try — watch the PC app's activity log (use "■ Expand" for a bigger view) to see it's keeping up before raising the number.
- **Videos can occasionally arrive empty (0 bytes)**, especially when the Shortcut runs with the screen locked/app backgrounded (the WiFi automation runs this way by design) — the server now detects and rejects this automatically, so it's never recorded as a real backup; the same video is simply retried on a later run instead. Keeping the screen on and the Shortcuts app in the foreground during a large manual run makes this much less likely to begin with.
- If a run gets interrupted (you leave home, or tap Stop), nothing is lost — anything already uploaded stays backed up permanently. The next run just starts sweeping from your newest photos again rather than exactly where it left off; the already-completed blocks re-check quickly (no file transfer) before it reaches new ground.
- If the Shortcut itself appears to freeze with no error and no visible cause (rare, but a known Shortcuts app quirk unrelated to this system), force-quit it from the app switcher and run it again — nothing gets corrupted by an interrupted run, see the point above.

The phone freezes while the Shortcut runs

- Go to **iPhone Settings** → **Display & Brightness** → **Auto-Lock** → **Never** (temporarily, while running a large backup).
- Runs with thousands of photos can take several minutes — that's normal, not a freeze.
- If it truly stops responding: a forced restart of the iPhone is safe, nothing is lost (the server-side run is just left unfinished, harmlessly).

The Shortcut's final notification shows blank numbers (New/Already had/Conflicts)

Known cosmetic issue — the step that closes out the run (`/run/finish`) sometimes doesn't complete, so the summary doesn't always carry the numbers. **This doesn't affect the actual backup**: files still upload and save correctly. To confirm something was really saved, check the destination folder directly (see next section).

How to check files are really being saved

No technical steps needed: open the destination folder you chose in Windows Explorer — you should see Year/Month subfolders with your photos and videos inside.

Still not working

Contact whoever helped you install the system, or check the project's GitHub repository to report the issue.
